
What History Should We Teach And Why?

An Historian's Response

Dianne Harris

Dianne Harris holds a Ph.D. in Architectural History, a Master's in Architecture, and a Bachelor's in Landscape Architecture from the University of California, Berkeley. She is currently Assistant Professor in the Departments of Landscape Architecture and Architecture at the University of Illinois at Urbana-Champaign, where she teaches design and history courses. Her areas of specialization include architecture, urbanism, and landscape in Italy during the seventeenth and eighteenth centuries, and North American landscape architecture during the nineteenth and twentieth centuries.

Abstract: *This essay responds to two recently published articles in Landscape Journal that proposed methods and models of instruction for history courses in landscape architectural curricula. It argues for the importance of history as a mechanism for cultural and intellectual enfranchisement rather than as instrumental to the design studio, and posits an alternative model for the teaching of landscape history.*

Twenty years ago, the *Journal of Architectural Education* devoted an entire issue to topics related to landscape studies. Titled "Teaching the Landscape" and guest edited by J. B. Jackson, the issue contained essays by Yi-Fu Tuan, Peirce Lewis, John Stilgoe, Marc Treib, Elizabeth Blackmar, and Richard Park.¹ Each essay addressed the study and teaching of landscape history in professional design schools, with particular focus on the role of cultural or vernacular landscape studies. In the years since that issue appeared, cultural landscape courses have become an important component in the curriculum of many landscape architecture departments in the United States. But general survey courses in landscape history—those that include so-called "high style" design—have not fared as well. Judging by two recent essays that appeared in *Landscape Journal*, the first by Robert Riley (1995), the second by Catherine Ward Thompson and Peter Aspinall (1996), problems surrounding the teaching of landscape history are more acute than they were in 1976.

The essays differ substantially in their focus. Riley posited three alternative approaches for teaching landscape history: a history of landscape form, a social history of landscape, and a history of landscape change. His concise and provocative essay raised important questions; his alternatives included thoughtful possibilities that allowed for a range of approaches. The essay by Ward Thompson and Aspinall attempted to grapple with a range of educational issues and theories, including history. Unfortunately, they took what I believe to be the least favorable of Riley's alternatives and made an argument for teaching history in a manner I find problematic. But the common link between the two pieces is a shared instrumentalist assumption that landscape history, as taught to students in professional degree programs in landscape architecture, should be directly useful or applicable in the design studio. Ward Thompson and Aspinall stated that "... ideally the teaching of history feeds directly

into the design studio, or at least supports it. Information on historical landscapes will be perceived by students as useful if it is taught in the context of what is needed for design practice" (Ward Thompson and Aspinall, p. 46). Moreover, their stated objectives in the essay are: 1) "a discussion of ways of making the learning of history meaningful to those who are focused on becoming practicing landscape architects," and 2) "how history can be used to aid and demystify the design process" (Ward Thompson and Aspinall, p. 46). Likewise, Riley asserted that "History should inform design and vice versa," and that "The history we teach must be relevant to design" (Riley pp. 220, 221).²

Debates about the nature and quality of history courses in schools of architecture and landscape architecture are not new, though landscape history has received far less attention.³ Such self-evaluation is healthy, a necessity for the maintenance of high academic standards. But the essay by Ward Thompson and Aspinall conflated multiple issues that need separating. It may be a

problem, as they asserted, that some modernist studios reject history, thereby leaving students totally ignorant of the past and without a vocabulary of form and prototypes to draw from in the studio. Indeed, many students have an insufficient knowledge of the designed world and lack the ability to think critically about the world they encounter. Problems unquestionably exist in the modes of instruction for both design and history courses. But conflating the two, or worse yet, eliminating history courses altogether—as the authors seem to suggest—is no solution.

Ward Thompson and Aspinall's proposal that we teach "history as design studio" lacked clarity but raised troubling questions in its suggestion that the studio substitute for history courses. Teaching history as design studio, they argue, "would validate the teaching of history by amateur historians who are also design studio instructors, as in so many landscape architecture schools today" (Ward Thompson and Aspinall, p. 46). True, some landscape history courses are well taught by faculty whose primary training and interests lie in design. But is this how we should determine the course of education in landscape history? Should it be based on a justification for the underqualification of some who teach it? Should landscape history continue to be taught by amateur historians? How does their training and perspective differ from an historian's? How does these differences affect the ways history is taught?

This essay, written by an architectural and landscape historian who also holds an advanced professional degree in architecture, addresses the following questions:

- 1) Why should we teach courses in landscape history?
- 2) Must history be "useful," and if so, in what ways is it useful and to whom?
- 3) Who should teach history courses and why?
- 4) What should a landscape history course consist of, and how might it be taught?

Although the value of survey courses has come into question, this paper assumes their continued role and significance in landscape architecture curricula. A well-taught

undergraduate survey is a demanding and complex course and is easily dismissed by those who do not wish to tackle its requirements. But the curricula of professional degree programs frequently restrict students' opportunities for exposure to courses outside their department. The survey course then becomes the place where many landscape architecture students receive important exposure to history, cultural studies, and the humanities—a point I will expand on below.

Before focusing on the four points outlined above, I would like to address a critical flaw in the Ward Thompson/Aspinall essay: the authors neglected the important distinctions between antiquarianism, connoisseurship, criticism, and history.⁴ Counted among the important founding structures of art history, antiquarianism's primary endeavors involve collection of data and proper attribution of creator, style, and date of creation. It is concerned with definitions of beauty and stylistic cycles. It is rarely interpretative and seldom objective.⁵ Connoisseurship is more closely related to criticism since it involves the ability to make informed distinctions between works of varying type and quality and to give critical appraisal based on discriminations related to style, aesthetic judgment, and taste. Most design students could no doubt benefit from such training, but antiquarianism and connoisseurship remain distinct from the contemporary historian's practice. Likewise, history and criticism are separate endeavors; both are necessary in design education but for different reasons. As Richard Park wrote twenty years ago, "Landscape studies is not problem solving (although it serves this indirectly), it is not antiquarianism, is not merely the history of self-conscious design, and is not a superficial and entertaining glance at pop-culture. Designers need something in addition to what these can offer" (Park 1976, p. 11). From criticism, which includes detailed formal analysis and critique of built works, students gain important knowledge that can be applied in design and in professional endeavors. As Spiro Kostof wrote, "The critic speaks of architecture as it should be . . . the historian as it was" (Kostof 1967, p. 191).⁶ The historian's task is to document, but also to question and

explain within the broadest possible context. Both are essential parts of design education. But one cannot substitute for the other. The lessons of history are too abstract, the rewards of the investment often too distant to be immediately applied in an instrumental fashion.

Why Should We Teach Courses in Landscape History?

We teach courses in landscape history because we wish to enfranchise our students intellectually. The landscape history course is frequently a design student's first exposure to cultural history. As such, it provides a framework for active engagement with surroundings rather than passive observation of an indecipherable scene. Intellectual and cultural enfranchisement involves giving students the means to question, analyze, and understand the built environment in a deliberate way, by using a variety of tools and perspectives. To assume that the history of the built environment can only be meaningful for design students if it has direct application in the studio is to demean their intelligence and capacity for learning. I disagree with Ward Thompson and Aspinall's assertion that we teach history because it provides precedents or prototypes for future design strategies. This may be a beneficial by-product of the history course, but should not be its primary objective. All design students begin with a limited vocabulary of forms and built works. Certainly the history course exposes them to many more. But history is more than a grab bag of ideas for application in the studio.

Landscape history helps students understand the ramifications of their interventions in the landscape and of those made by civilizations that have come before—the formal consequences of culture and the cultural consequences of form. Like other courses in world history or cultural studies, it fosters knowledge about cultures and societies around the world—their values and beliefs—but goes further to show how those have in turn been given shape in the material world. Much design curriculum aims at the training of future professionals. History courses aim to educate them and provide the means

for understanding the cultural forces from which the built environment results.

As noted in the recently published report on standards in architectural education by Ernest Boyer and Lee Mitgang, "To understand the ethical choices entailed in *any* profession, students should be exposed to how the great figures in history, literature, philosophy, and the arts have struggled with life's moral dilemmas. These are the needs that make a true liberal education so essential to the future of the architecture profession" (Boyer and Mitgang 1996, p. 77).⁷ Ethical questions are at the core of landscape architectural practice and so have real importance. History courses deal with the way such questions have been handled through time and the resultant consequences.

Must History Be Useful?

The assumption that history must be directly instrumental in the design studio is not a new notion, and debates regarding the role of history in design schools mark a recurrent theme in the design education journals. Dell Upton has pointed out the problems for historians teaching in professional programs. Examining the development of architectural history education, Upton identified the problems associated with an endeavor that has unwittingly and inappropriately become "the public relations branch of the profession" such that the history of architecture became "the story of the progress of the profession envisioned as the uncertain triumph of high culture over low" (Upton 1991, pp. 195-96). He noted further that "the categories of high and low, of art and intention that it embodies, are artifacts of professionalization in Western commercial society . . . When historians take on the profession's narrative, however, these categories are absorbed into our own analysis and escape scrutiny" (Upton 1991, p. 197). This problem may appear more strikingly in architectural history than landscape history. After all, we have no equivalent to Sigfried Gideon's blatant promotion of the architects of the modern movement. But critical examination of most landscape history surveys—Norman Newton's *Design on the Land* comes immediately to mind—reveals

a structure that similarly takes on the profession's narrative.

Published examples of outstanding scholarship have begun to appear with increasing frequency, yet landscape history, as predominantly taught today, suffers from exactly this lack of scrutiny—a problem that can only be compounded by an instrumentalist approach. Additionally, we lack a critical analysis of the history of the profession of landscape architecture, nor is there a carefully written historiography of the field.⁸ We have no equivalent to Spiro Kostof's edited volume, *The Architect: Chapters in the History of the Profession* (Kostof 1977; 1986). We have nothing that parallels the art or architectural historiographies of David Watkin (1980), Michael Podro (1982), or Bruce Allsopp (1970). The void in landscape architectural historiography and professional self-scrutiny begets a historical narrative deeply entrenched with promotion of the profession through glorification of individual designers and works. Although the landscape architecture profession may need promotion, and landscape architects lack adequate public visibility, the historian's job is not to glorify the individual designer, nor is it to promote the profession of landscape architecture. Quite the contrary, good historians value their objectivity, their ability to analyze with the distance afforded by lack of embedded interest. This is not to say the historian's work should lack passion. But it must remain separate from professional advocacy.

History may not be immediately useful in the studio, but it can teach the significance of the landscape and help us understand the long-term impact of design on the land. It helps us see where we've been and hints at where we might be going. This is, in part, the value of history for designers: history reinforces the fact that it is incumbent on the designer to be culturally and environmentally responsible. History is useful for designers then, but in a much more abstract way than that proposed in the prior essays.

Who Should Teach History Courses and Why?

Admittedly, this is a question of some sensitivity, but I believe it has

relevance well beyond the question of defending academic turf. Riley's question bears repeating: "How then did history become an indispensable requirement for education in our discipline and simultaneously a subject that almost anyone can teach when faculty rotations are required?" (Riley, 1995, p. 221). The answer, of course, is related to questions of educational quality. Almost anyone can teach almost anything if pressed to service, but not necessarily well. In the major universities of this country, laboratory scientists are not asked to teach the history of science, artists do not teach art history, and to bring the parallel closer to home, architects are infrequently asked to teach architectural history. As Riley noted, architecture departments typically require the Ph.D. for instruction in history.

If our history courses are to have rigor, they must be taught by rigorously trained historians. Such educational preparation includes a thorough knowledge not only of historical "information," but perhaps more important, rigorous training in the theories and methodological approaches that inform the historian's craft. For example, if we are to discuss meaning with relation to landscape, surely we should have a solid grounding in the studies of iconography and iconology, a knowledge of the writings of Panofsky (1955) and Cassirer (1979).⁹ If we are to practice the deep contextualization needed for good landscape history, should we not be familiar with the Braudelian and Annales School's *longue durée*, as well as with Pierre Bourdieu's more recent contributions regarding "radical contextualization" (Braudel 1979; 1980; Bourdieu 1984; 1993)?¹⁰ If we are to address shifting attitudes toward ideas about nature, we should have studied writings by (to name a few) Aristotle, Plutarch, Pliny, and so on, as well as the secondary analyses by Frankfurt School philosophers, Marxist historians and environmental historians from the past 150 years.¹¹ These represent a portion of the material that should be part of a well-trained historian's tool box. Doctoral training in architectural or art history—the disciplines in which most landscape or garden historians are currently schooled—requires a tremendous amount of

critical reading and working knowledge of a broad range of bibliographic sources—far more than that included in a designer's education.

Teaching history also requires a thorough knowledge of historiography so that texts, both current and past, do not escape critical scrutiny within a broader historical context. Familiarity with more than one language remains a necessity in order to keep abreast of recent findings by scholars in the international community. Naturally it is important to keep up with the most recent research and published studies in a wide range of fields including the literature on garden and landscape history. But it is equally important for landscape historians to keep abreast of recent works in history, sociology, critical theory, cultural geography, environmental and ecological history, and art and architectural history. Riley similarly argued for discriminating and informed cross-disciplinary scholarship and for "reflection on our own habits" (Riley, 1995, p. 221). But few design faculty have the background or the desire to maintain current knowledge in such a wide range of disciplines. Indeed, they should not be required to when they have their own areas of specialization to pursue, their own important contributions to make. It must be noted that at present, no doctoral program exists that grants a degree in landscape history and theory. Therefore, the historians who specialize in landscape history will continue to come from a wide variety of backgrounds and disciplines, but this may be an asset since landscape history is inherently interdisciplinary. Fundamentally, it should not matter whether or not history is taught by a certifiable, card-carrying historian or by a landscape architect assigned to the course, as long as it is taught well by a knowledgeable individual with the proper capabilities and background as outlined above.

What Should a Landscape History Course Consist of and How Might it be Taught?

Many landscape history courses rely on description and detailed formal analysis, and rightly so, since this is one of the important tools for histo-

rians of visual culture. But description and formal analysis alone are not enough. A well-taught course in landscape history should ask, "What are the conditions that produce landscapes and cities and their representational systems?" It should examine spatial morphology to get a richer understanding of cultural dynamics. It must also aim at a more complete picture of historical and cultural processes and their ramifications for the built environment at selected sites. Robert Riley came closest to this model with his proposed "social history or a history of meaning . . . landscape as an artifact created, maintained, and evolved in a cultural context" (Riley, 1995, p. 223).¹² Likewise Ward Thompson and Aspinall acknowledged the importance of studying the societal context in which built works were developed, but their emphasis on history as instrumental to design studio undermines such an approach.

Good landscape history courses are challenging, and they make students think, write, conduct research, and ask questions about the world around them. As one of the few courses in design programs that require research and writing assignments, they also continue and maintain development of literacy and verbal skills. Design problems or graphic/drawing assignments, then, should not substitute for research papers in history courses. First, such substitution deprives students of an opportunity to write—they already get plenty of practice drawing and designing in their other classes. Second, it sends the wrong message to design students, assuming that they need not develop language and analytical skills, and worse, that perhaps they are not capable or intelligent enough to complete such an assignment. In an information-based society governed by language, we cannot afford to send such negative messages to students.

I have already argued that good landscape history is that which examines the built environment within the broadest possible context and that, in essence, treats the landscape as an artifact of material culture. Indeed, material culture studies provide an excellent model for the study and teaching of landscape history. James

Deetz has defined material culture as "that segment of man's physical environment which is purposely shaped by him according to culturally dictated plans" (Deetz 1977, pp. 24–25). Study of the landscape fits quite naturally into such a definition. Thomas Schlereth's definition of material culture further elucidated the definitions and methods of the discipline which he called "a process whereby we attempt to see through objects (not just the objects themselves) to the cultural meaning to which they relate or that they might mediate," and he has noted that "starting with land and its natural features is a fundamental strategy for material culture analysis. . . ." According to Schlereth, a "landscape reveals, when rightly seen, as much of a society's culture as does a novel, a newspaper, or a Fourth of July oration," and that landscapes are "palimpsests of linguistic, economic, technological, and social history." He calls his work "above-ground archaeology, a series of techniques for identifying, interrogating and interpreting the natural and built environment in order to gain an increased sensitivity to an understanding of life as lived in the past." With this approach, "historical knowledge about humankind is the principal learning objective" (Schlereth 1990; 1992, pp. 31, 38–40).

Material culture, as a discipline and as a method, allows the breadth of inquiry necessary for the type of landscape history I am advocating—indeed, it requires it. It is certainly not the only possible model. But it gives a name, a focus, and a structure to a mode of scholarship and study that can be most useful for landscape historians. And we are sorely in need of such models. After all, we lack even an appropriate history text for assignments in our survey courses. It may strike some scholars as strange to conceptualize the landscape as an object or artifact. But as Dell Upton has written, "whatever else they might be, artifacts are at the deepest level expressive forms. The manufacture of an artifact is an act of creation equal to, rather than reflective of, the manufacture of a social system or an intellectual concept. All are part of the symbolic process that con-

tinuously recreates the world by imposing meaning and order on it. As a primary phenomenon equal to social structure and intellectual reasoning, the artifact must be questioned on its own terms" (Upton 1985, pp. 85, 87). If we substitute the word "landscape" for "artifact" in Upton's statements, we can see the applicability of his argument.

Examples of such deeply contextualized landscape histories are beginning to appear, though authors may refer to their method or approach in varying terms and come from backgrounds such as cultural geography, anthropology, or environmental history in addition to art and architectural history. Thomas Schlereth's 1990 essay, "Plants Past" provides a brief but clear model, or one could look equally to Denis Cosgrove's 1993 *Palladian Landscape* as an example that uses a wide range of documentary sources and artifacts to shed new light on the landscape—not merely the gardens, which receive little attention in his study—of the 16th-century Veneto.¹³ Chandra Mukerji's recently published *Territorial Ambitions and the Gardens of Versailles* provides another example of a synthetic approach that links the world of objects to the manufacture of garden form. Her deft handling of a wide range of archival and published sources examined along with 17th-century French pottery, lace, fabric, costume, carpets and tools (to name a few) casts Versailles within a new scholarly framework, and demonstrates, as Mukerji wrote, that "essential social processes are illuminated in (gardens) that are just not easy to study elsewhere" (Mukerji, p. 35). New examples are beginning to appear, but it remains for the instructor/historian to assemble, analyze, and synthesize, since only fragments exist in the current literature.

Still, questions related to the structure of the survey course remain. Ward Thompson and Aspinall appropriately wonder what can be realistically aimed for within the practical constraints of departmental curricula and budgets. The structure of many professional degree programs disallows a wide range of history offerings which, after all, fulfill no part of the accreditation board's requirements. Yet we must aim for the highest aca-

demical standards. In order to expand students' exposure, a year-long history survey course might be required for majors and, if at all possible, for architecture students as well. Likewise, landscape architecture students should be encouraged to take the survey course in architectural history and a range of additional offerings that might include courses in urban history or the vernacular landscape. These courses should fulfill both general education requirements and those of the major.

By expanding the survey to a full year, problems surrounding the selection of material for inclusion are somewhat mitigated. The canons that we create when we try to compress the entire history of the designed landscape into approximately fourteen weeks become absurdly distorted. True, they are only slightly less so when we have twice the time. Selection of material for such courses remains a great challenge—we cannot cover everything, nor should we try. Careful, thoughtful selection based on a philosophy of cultural inclusiveness—not high versus low, western versus non-western—must guide us. The distortion can be mitigated by offering additional courses in the history of the built environment to supplement the survey and serve as a continuous narrative thread that runs through the design student's education.¹⁴

Finally, we must teach history with a passion that is commensurate with the effort involved in the creation of the artifacts with which we are concerned. We must craft lectures that captivate our students through careful interpretation that includes strong conceptual and analytical frameworks. If we fail in our efforts, and if we allow the decline and demise of landscape history courses by teaching them as criticism or as strictly instrumental to the design studio, our legacy will be generations of designers whose decreasing levels of historical literacy will result in a debased society and, ultimately, a debased environment.

Acknowledgments:

My thanks to Louise Mazingo, Brenda Brown, and the two anonymous readers for comments on early drafts of this paper. Thanks also to Bob Riley for raising these important questions in a public forum. Responsibility for the opinions expressed herein lies strictly with the author. This essay is dedicated to Dell Upton and Stephen Tobriner. Their example as scholars, teachers, and historians and their commitment to "the enterprise" continues to inspire their students to strive for excellence and to value history as a crucial component in design education.

Notes

1. *Journal of Architectural Education* 33(1) (September).
2. Both articles were prompted by a series of recent symposia focused on landscape history and design education organized by Eliza Pennypacker and Dan Nadinicek at Pennsylvania State University, and Roundtables on the subject held at Dumbarton Oaks.
3. See *Journal of the Society of Architectural Historians* (1942) and *Journal of the Society of Architectural Historians* 26 (1967), both of which are devoted to an exploration of the role of architectural history within professional schools of architecture. See also *Journal of Architectural Education* 34(1) (Fall 1980). The volume is titled "How Not to Teach Architectural History" and addresses the same questions. But as Richard Betts and Spiro Kostof have noted, the question of history's significance to the architect can be traced at least as far back as Vitruvius, who wrote two thousand years ago that for an architect's education "a wide knowledge of history is requisite because, among the ornamental parts of an architect's design for a work, there are many the underlying idea of whose employment he should be able to explain to inquirers." See Spiro Kostof, "Architectural History and the Student Architect: A Symposium," in *Journal of the Society of Architectural Historians* 26 (1967): p. 189 and Richard Betts, "Historical Determinism, or Historical Precedent Be Damned," *Journal of Architectural Education* (Fall 1980): p. 3, and Vitruvius, *The Ten Books on Architecture*, Morris Hickey Morgan transl. (New York: Dover Publications, 1914, 1960), Book I.5, p. 6.
4. Ward Thompson and Aspinall repeatedly conflate history and criticism in their essay. For example, the authors claim we need to learn about "famous gardens and regional types—but also how to criticize and re-evaluate these" (p. 42). Evaluation or critique of historic precedents or contemporary built works is a crucial component of design education, but it should take place in the studio and the seminar—not in the history course. Similarly the authors provided three reasons to teach history: "a) as an education in (or dialogue with) our tradition, b) in order to make a critical assessment of past designs in their context, and c) to help students acquire a vocabulary of prototypes or solution types which will assist them in the design studio" (p. 41). The first reason is endorsable for a history course; the second

and third fall, once again, in the domain of the critic or connoisseur.

5. On connoisseurship see Richard Wollheim, "Giovanni Morelli and the Origins of Scientific Connoisseurship," in *On Art and the Mind* (Cambridge: Harvard University Press, 1973). On antiquarianism see David F. Anstis, "Architectural History and the Student Architect," *Journal of the Society of Architectural Historians* 26 (1967): p. 182.

6. Kostof wrote "The future architect wants above all to be told what architecture is good, what bad: it is the historian's special responsibility not to oblige. His task is not that of the critic" (Kostof 1967, p. 191).

7. Mitgang and Boyer illustrated the scope of the problem with the following: "One of the most sobering moments of our campus visits occurred when we asked a fourth-year student to describe his school's humanities courses. He replied: 'What are humanities?'" (p. 78).

8. The May, 1997 Dumbarton Oaks symposium on landscape historiography begins to correct the problem.

9. On iconology see also W. J. T. Mitchell, *Iconology: Image, Text, Ideology* (Chicago: University of Chicago Press, 1986); Michael Ann Holly, *Panofsky and the Foundations of Art History* (Ithaca: Cornell University Press, 1984); *The Iconography of Landscape*, Denis Cosgrove and Stephen Daniels, eds., (Cambridge University Press, 1989).

10. On the Annales school see Peter Burke, *The French Historical Revolution: The Annales School, 1929-1989* (Stanford: Stanford University Press, 1990); Traian Stoianovich, *French Historical Method, The Annales Paradigm* (Ithaca: Cornell University Press, 1976); Marc Bloch, *The Historian's Craft*, Peter Putnam, transl. (Manchester: Manchester University Press, 1963).

11. The writings of Aristotle, Plutarch, and Pliny, for example, are readily accessible through the publications of the Loeb Classical Library series of the Harvard University Press. For an overview of these writings about nature see Clarence Glacken, *Traces on the Rhodian Shore: Nature and Culture in Western Thought from Ancient Times to the End of the Eighteenth Century* (Berkeley: University of California Press, 1973); on the Frankfurt school, Marxist, and critical theoreticians' ideas about nature, see *Key Concepts in Critical Theory: Ecology*, Carolyn Merchant, ed. (Atlantic Highlands, NJ: Humanities Press International, 1994). The literature is extensive on these topics, but these sources provide a good starting point.

12. Riley reiterated this model stating, "The way to learn about the human landscape is to study it in terms of people in a place and not monuments, styles and periods or even 'honest vernacular'." (See p. 225.)

13. See also David Kingery, ed. *Learning from Things: Method and Theory of Material Culture Studies*. (Washington, D.C.: Smithsonian Institution, 1996). For another example of a deeply contextualized approach rooted in material culture, see Dianne Harris, "Lombardia Illuminata: The Formation of an Enlightenment Landscape in Eighteenth-Century Lombardy" (Ph.D. dissertation, University of California, Berkeley, 1996). In this study, I refer to "panoramic history," which refers to both the primary artifact upon which the dissertation is based—a series of panoramic prints—and to the scope of study

which includes art, architectural landscape, and environmental history within the context of Habsburg social and economic reforms.

14. This notion was supported by David F. Anstis who wrote, "Perhaps the real basis on which history should be studied is that of the acceptance of the fact that it is a *mature* and *maturing* study. This means that it cannot be hurried or compressed into convenient gaps in the syllabus. History needs to continue throughout the whole process of education: there may be a beginning but there is certainly no end." See David F. Anstis, "Architectural History and the Student Architect: A Symposium," *Journal of the Society of Architectural Historians* 26 (1967): p. 184.
